FRITZ-PAK

PLASTER DELAY SET LAB TEST

1. Purpose of the Lab Test

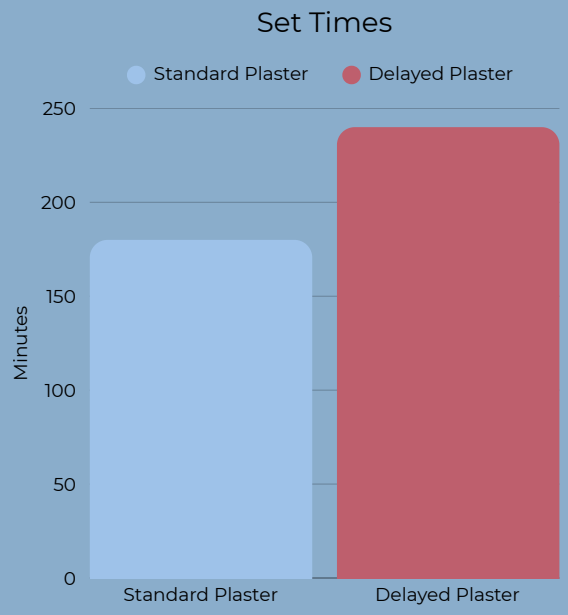
The following test evaluates how long the setting time of cement-based pool plaster can be delayed using Fritz-Pak's Plaster Delay Set admixture.

2. Lab Test Procedure

The test monitored the setting time of two different plaster mixes. Each mix was created using a commercially available plaster blend.

- Mix 1: Plaster mix and water only
- Mix 2: Plaster mix, water, and Fritz-Pak Plaster Delay Set
-

The mixes were placed into molds, and the workability of each mix was tested every 30 minutes using a palette knife.



3. Results

The test results demonstrated that Fritz-Pak's Plaster Delay Set slows down the setting time of plaster by approximately one hour.

- The standard plaster mix lost all workability after three hours.
- The delayed plaster mix lost all workability after four hours.

4. Product Overview

Fritz-Pak's Plaster Delay Set is a white, powdered admixture specifically designed to extend the working time of plaster mixes without affecting color or finish quality. It comes packaged in our signature water-soluble bag for easy and accurate dosing at the job site.
